

## To whom It may concern

CHAMCO is a privately held process engineering company, with capabilities of international engineering services.

CHAMCO works exclusively in the US with Indian Tribes only, "Native American Environmental Group" and we are based in Barnsdall, North of Tulsa, Oklahoma, USA.

CHAMCO presents its start of works in the field of turning Municipal Solid Waste into Energy with a letter, which is posted in the frontpage of our website, "..... a letter" dated 2005.

Furthermore, CHAMCO has the know-how and manufactured and build two small 1 MW power plant using MSW as fuel power technology and gasification in India.

Since handling garbage and generating electricity will involve Municipalities and Energy Authorities and in most cases a Government decision and requires a substantial amount of investment, we have changed our proposals this year.

We do not propose to build a 1 MW pilot plant and expand that to a higher MW.

We propose to handle landfills with incoming garbage of few thousand Tons per day and generating fifty or more Mega Watts

We have partner with a leading mechanical engineering company in China, CMEC ([www.cmec.com](http://www.cmec.com)) for such a size project.

For the suburbs of the big Cities, with small amount of garbage we use our CHAMCO Gasification to generate one to five Mega Watts.

Visits to a 50 MW power plant in operation in Africa using MSW as fuel will be arranged after receiving LOI and proof of financing by client.

Sincerely,

Sohrab ChamanAra  
CHAMCO, Inc.
